Automatic - FLOW for Materials Discovery

# Directory Content and Navigation

## Directory content

- List content of current directory

```
ls
```

- Also list hidden files

```
ls -a
```

- Show content as a list

```
ls -l
```

- Options can be combined

```
ls -la
```

- List a different directory

```
ls -la path
```

## Directory navigation

- Change directory/go to *dir*

```
cd dir
```

- Go multiple levels

```
cd dir1/dir2/dir3
```

- Go up one layer

```
cd ..
```

- Go to home directory

```
cd ~
```

- Go to recently visited directory

```
cd -
```

**Note:** italicized words are placeholders

# Manipulating Files and Directories

## Files

- Create empty file

```
touch file
```

- Copy file

```
cp src dest
```

- Remove/delete file

```
rm file
```

- Move/rename file

```
mv src dest
```

## Directories

- Create empty directory

```
mkdir directory
```

- Copy directory

```
cp -r src dest
```

- Remove/delete directory

```
rm -r directory
```

- Move/rename directory

```
mv src dest
```

**Warning: removing files/directories with rm is permanent – there is no recycle bin!**

# Outputs and Redirects

## Outputs

- Output file to screen

```
cat file
```

- Output multiple files

```
cat file1 file2
```

- Output all files (careful!)

```
cat *
```

- Output a string to screen

```
echo "Hello world!"
```

**\* is a so-called “wild card” and will match everything – especially dangerous with rm.**

## Redirects

- Redirect to another program (pipe)

```
cat file | tac
```

- Alternative:

```
tac < file
```

- Redirect to file (overwrites *file2*)

```
cat file1 > file2
```

- Concatenate files

```
cat f1 f2 > f3
```

- Append to new file instead

```
cat file1 >> file2
```

**Redirects also work with “echo”**

# Other Useful Features/Hints

- Autocomplete
  - Hitting the `tab` key autocompletes input as much as possible
  - Examples:
    - A directory contains the directories `lorem` and `ipsum`. Typing `cd l` and hitting `tab` autocompletes to `cd lorem`
    - A directory contains the directories `dir1`, `dir2`, and `lorem`. Typing `cd d` and hitting `tab` autocompletes to `cd dir`. Hitting `tab` repeatedly will show `dir1` and `dir2` as possible options.
- Arrow keys:
  - `Left` and `right`: move the cursor to edit a command
  - `Up` and `down`: cycles through previous commands
- Canceling a process or input: `Ctrl + C`
- Copying/pasting:
  - Highlighting copies to the clipboard
  - Pasting: depends on the terminal, typically middle mouse button or right click

# Exercises

1. Create a new directory called `exercise` and navigate into the directory.
2. Copy the file `lorem.txt` from `dir1` into the directory.
3. Concatenate the contents of the file `lorem.txt` and `sit.txt` from `dir1` into a new file.
4. Append the contents of `sit.txt` from `dir1` to the new file.
5. Hide the file.
